1. Overview

This term project focuses on implementing a **Simple Genetic Algorithm (SGA)** to solve optimization problems by using specific objective functions and with the additional functionality of implementing an objective function of your choice. Three well-known objective functions were chosen to evaluate the performance of the Simple Genetic Algorithm, followed by 2 custom functions provided by Dr. Ilias S. Kotsireas, Professor.

- **Sphere Function:** $f(x) = \sum_{i=1}^n x_i^2$, a straightforward uni modal function used to assess how well the SGA can converge towards the global minimum of $[0, 0]$.
- **Rosenbrock Function:** $f(x) = \sum_{i=1}^{n-1} [100(x_{i+1} - x_i^2)^2 + (1 - x_i)^2]$, a non-convex function used to test the SGA's ability of handling difficult and non-straightforward optimization problems. The functions global minimum is $[1,1]$.
- **Himmelblau Function:** $f(x, y) = (x^2 + y - 11)^2 + (x + y^2 - 7)^2$, a multimodal function with several local minima, providing a challenging test for the SGA's capabilities. The function has four global minima at $[3.0, 2.0]$, $[-2.805118, 3.131312]$, $[-3.779310, -3.283186]$, and $[3.584428, -1.848126]$.

Key features that we have implemented in SGA include adjustable parameters (e.g., population size, mutation rate, and number of generations) and the ability to visualize convergence through fitness plots using Python's Matplotlib library. Additionally, a Graphical User Interface (GUI) was developed using Python's Tkinter library, allowing for an smooth function selection and parameter configuration.

2. Key Data Structures in Genetic Algorithm Design

The Simple Genetic Algorithm (GA) has the following data structures implemented:

1. **Population Initialization:** Generating solutions randomly within defined limits.

```

1 # Create population with random variables within bounds
2 population = np.random.uniform(
3     [b[0] for b in bounds], # Lower bounds
4     [b[1] for b in bounds], # Upper bounds
5     (population_size, dim)  # Shape of population
6 )

```

Listing 1: Population Initialization Code

2. **Fitness Evaluation:** Using the objective functions to assess solution quality.

```

1 # Obtain fitness of every individual
2 fitness = np.array([objective_function(ind) for ind in population])

```

Listing 2: Fitness Evaluation Code

3. **Selection:** Utilizing a biased roulette wheel approach to favor fitter individuals.

```
1 # Calculate probabilities for biased wheel
2 total_fitness = np.sum(fitness)
3 selection_probs = (1 / (fitness + 1e-6)) / total_fitness
4
5 # Normalize (ensure probabilities add to 1)
6 selection_probs /= np.sum(selection_probs)
7
8 # Select mating pool based on biased wheel
9 selected = population[np.random.choice(len(population), size=
    population_size, p=selection_probs)]
```

Listing 3: Selection Code

4. **Crossover:** Combining genetic material from two parents to create child.

```
1 # Create offspring using crossover
2 offspring = []
3 for _ in range((population_size - num_elites) // 2):
4     # Randomly select 2 parents from mating pool
5     p1, p2 = selected[np.random.choice(len(selected), size=2)]
6
7     # Create crossover point and make children based on parents and
8     # crossover point
9     crossover_point = np.random.randint(1, dim)
10    child1 = np.concatenate((p1[:crossover_point], p2[
11        crossover_point:]))
12    child2 = np.concatenate((p2[:crossover_point], p1[
13        crossover_point:]))
14
15    # Add children to list
16    offspring.append(child1)
17    offspring.append(child2)
```

Listing 4: Crossover Code

5. **Mutation:** Introducing random genetic variation to maintain diversity.

```
1 # Chance to mutate a child
2 if np.random.rand() < mutation_rate:
3     child1 += np.random.uniform(-0.1, 0.1, dim)
4 if np.random.rand() < mutation_rate:
5     child2 += np.random.uniform(-0.1, 0.1, dim)
```

Listing 5: Mutation Code

6. **Elitism:** Preserving the best solutions across generations.

```
1 # Keep track of elites in the generation
2 elite_indices = np.argsort(fitness)[:num_elites]
3 elite_individuals = population[elite_indices]
4
5 # Replace old population with elites and children
6 population = np.vstack((elite_individuals, np.array(offspring)))
```

Listing 6: Elitism Code

7. Exploration vs. Exploitation:

- **Exploration:** Ensuring global search through mutation to introduce diversity.

```

1 # Mutation introduces diversity by adding random noise to
  offspring
2 if np.random.rand() < mutation_rate:
3     child1 += np.random.uniform(-0.1, 0.1, dim)
4 if np.random.rand() < mutation_rate:
5     child2 += np.random.uniform(-0.1, 0.1, dim)

```

Listing 7: Exploration Code

- **Exploitation:** Refining promising solutions through selection and elitism.

```

1 # Selection biases towards fitter individuals
2 selection_probs = (1 / (fitness + 1e-6)) / total_fitness
3 selection_probs /= np.sum(selection_probs)
4 selected = population[np.random.choice(len(population), size=
  population_size, p=selection_probs)]
5
6 # Elitism: Retain the best-performing individuals
7 elite_indices = np.argsort(fitness)[:num_elites]
8 elite_individuals = population[elite_indices]
9 population = np.vstack((elite_individuals, np.array(offspring))
  )

```

Listing 8: Exploitation Code

8. Convergence: Ensuring the algorithm reaches a solution over generations.

```

1 # Convergence is determined by running the algorithm for a fixed
  number of generations
2 for generation in range(generations):
3     # Evaluate fitness for the current population
4     fitness = np.array([objective_function(ind) for ind in
      population])
5
6     # Track the best fitness in the current generation
7     best_individual_gen = population[np.argmin([objective_function(
      ind) for ind in population])]
8     best_fitness_gen = objective_function(best_individual_gen)
9     best_fitness_per_generation.append(best_fitness_gen)
10
11     # Print generation progress
12     print(f"Generation_{generation+1} - Best Solution: {
      best_individual_gen}, Fitness: {best_fitness_gen}")
13
14 # Obtain the final best solution and fitness score after all
  generations
15 best_individual = population[np.argmin([objective_function(ind) for
    ind in population])]
16 best_fitness = objective_function(best_individual)
17 print("\nFinal Best Solution:", best_individual)
18 print("Final Fitness Score:", best_fitness)
19
20 # Plot the fitness over generations to visualize convergence
21 plt.plot(range(1, generations + 1), best_fitness_per_generation)

```

```
22 plt.xlabel("Generation")
23 plt.ylabel("Best_Fitness")
24 plt.title("Best_Fitness_Over_Generations")
25 plt.grid(True)
26 plt.show()
```

Listing 9: Convergence Code

3. Visualization and User Interface

The implementation of the Simple Genetic Algorithm (SGA) includes both visualization of the best fitness over number of generation and a Graphical User Interface (GUI) to increase usability and provide insights into the algorithm's performance.

3.1 Visualization

To visualize the algorithm's performance, a fitness plot is generated using Matplotlib. The plot tracks the best fitness value across generations, providing a clear representation of the algorithm's convergence.

```
1 # Plot the fitness over generations
2 plt.plot(range(1, generations + 1), best_fitness_per_generation)
3 plt.xlabel("Generation")
4 plt.ylabel("Best_Fitness")
5 plt.title("Best_Fitness_Over_Generations")
6 plt.grid(True)
7 plt.show()
```

Listing 10: Fitness Plot Visualization Code

Figure 1: Sample Visualization of Fitness Convergence

Explanation:

- **X-axis:** Represents the generation number.
- **Y-axis:** Represents the best fitness value in each generation.
- **Purpose:** Tracks the convergence of the algorithm and identifies if it is improving or stagnating.

3.2 User Interface

A graphical user interface (GUI) was developed using Tkinter, making the Genetic Algorithm accessible to users without programming expertise. The interface provides options to:

- Select predefined objective functions or define a custom function.
- Input parameters such as population size, number of generations, and mutation rate.
- Specify bounds for variables dynamically.
- Start the Genetic Algorithm and display the results.

```

1  # Tkinter GUI
2  def run_gui():
3      def start_ga():
4          # Retrieve inputs
5          try:
6              objective_choice = int(obj_func_var.get())
7              if objective_choice == 1:
8                  objective_function = sphere_function
9              elif objective_choice == 2:
10                 objective_function = rosenbrock_function
11             elif objective_choice == 3:
12                 objective_function = himmelblau_function
13             elif objective_choice == 4:
14                 objective_function = n3_function
15             elif objective_choice == 5:
16                 objective_function = n5_function
17             elif objective_choice == 6:
18                 func_input = custom_func_entry.get()
19                 objective_function = eval(f"lambda x: {func_input}")
20             else:
21                 messagebox.showerror("Error", "Invalid objective_
22                                     function choice.")
23             return
24
25             num_variables = int(num_vars_entry.get())
26             bounds = []
27             for i in range(num_variables):
28                 bounds.append(tuple(map(float, bounds_entries[i].get().
29                                     split(','))))
30
31             population_size = int(pop_size_entry.get())

```

```

31         generations = int(generations_entry.get())
32         mutation_rate = float(mutation_rate_entry.get())
33
34         # Run GA
35         best_solution, best_fitness = genetic_algorithm(
36             objective_function, bounds, population_size, generations
37             , mutation_rate)
38         messagebox.showinfo(
39             "Best_Solution",
40             f"Best_Solution_Found: {best_solution}\nFinal_Fitness_Score
41             : {best_fitness}"
42         )
43     except Exception as e:

117        run_gui()

```

Listing 11: Tkinter GUI Setup Code

The image shows a graphical user interface window titled "Genetic Algorithm GUI". The window has a light blue title bar with standard minimize, maximize, and close buttons. The main content area is light gray and contains the following elements:

- Select Objective Function:** A section with four radio buttons: "Sphere Function", "Rosenbrock Function" (which is selected), "Himmelblau Function", and "Custom Function". A text input field is positioned to the right of the "Custom Function" radio button.
- Number of Variables:** A label followed by a text input field containing the value "2".
- Enter Bounds (min,max for each variable):** A label followed by a vertical stack of eight text input fields. The first two fields contain the value "-5,5".
- Population Size:** A label followed by a text input field containing the value "50".
- Generations:** A label followed by a text input field containing the value "100".
- Mutation Rate:** A label followed by a text input field containing the value "0.1".
- Start Genetic Algorithm:** A button located at the bottom right of the window.

Figure 2: Graphical User Interface for Genetic Algorithm

Explanation:

- The GUI features radio buttons for selecting objective functions and input fields for parameters.
- The "Start Genetic Algorithm" button triggers the computation and displays the best solution found.
- Users can define custom objective functions dynamically using the text field or are given the functionality of hardcoding.

4. Installation, Compilation, and Execution Instructions

The following steps provide clear instructions to set up and run the Genetic Algorithm project:

Prerequisites

Before running the project, ensure you have:

- **Python 3.8 or higher** installed on your system.
- A code editor or IDE (e.g., Visual Studio Code, PyCharm, or Notepad++).
- Basic knowledge of running commands in a terminal or command prompt.

You can check if Python is installed by running the following command in your terminal or command prompt:

```
1 python --version
```

Installing Required Libraries

The project requires the following Python libraries:

- **numpy**: For mathematical operations.
- **matplotlib**: For visualizing the fitness plot.
- **tkinter**: Pre-installed with Python and used for the GUI.

To install the missing libraries, run the following command:

```
1 pip install numpy matplotlib
```

You can confirm the installation by running:

```
1 pip show numpy matplotlib
```

Note: `tkinter` comes pre-installed with Python, so no additional installation is required.

Downloading the Project

- Download the project files (e.g., `genetic_algorithm.py`).
- Place all files in a single folder on your computer.

Running the Program

To execute the Genetic Algorithm and interact with the GUI:

1. Open your terminal or command prompt and navigate to the project folder:

```
1 cd path_to_your_project_folder
```

Replace `path_to_your_project_folder` with the actual path to the folder containing the program.

2. Run the program using Python:

```
1 python genetic_algorithm.py
```

3. The GUI will appear. Follow these steps to interact with it:

- Select an objective function (e.g., Sphere Function).
- Enter parameters such as the number of variables, bounds, population size, generations, and mutation rate.
- Click the **Start Genetic Algorithm** button to run the optimization.
- A popup will display the best solution and fitness score, and a fitness plot will appear.

Example Input

For testing purposes, use the following inputs:

- **Objective Function:** Sphere Function.
- **Number of Variables:** 2.
- **Bounds:** Enter -5,5 for both variables.
- **Population Size:** 50.
- **Generations:** 100.
- **Mutation Rate:** 0.1.

Troubleshooting

- If `numpy` or `matplotlib` is not installed, ensure you run the `pip install` command as described above.
- If Python is not recognized as a command, add it to your system's `PATH` variable during installation or reinstall Python.

5. Test Runs on Classical Benchmark Objective Functions

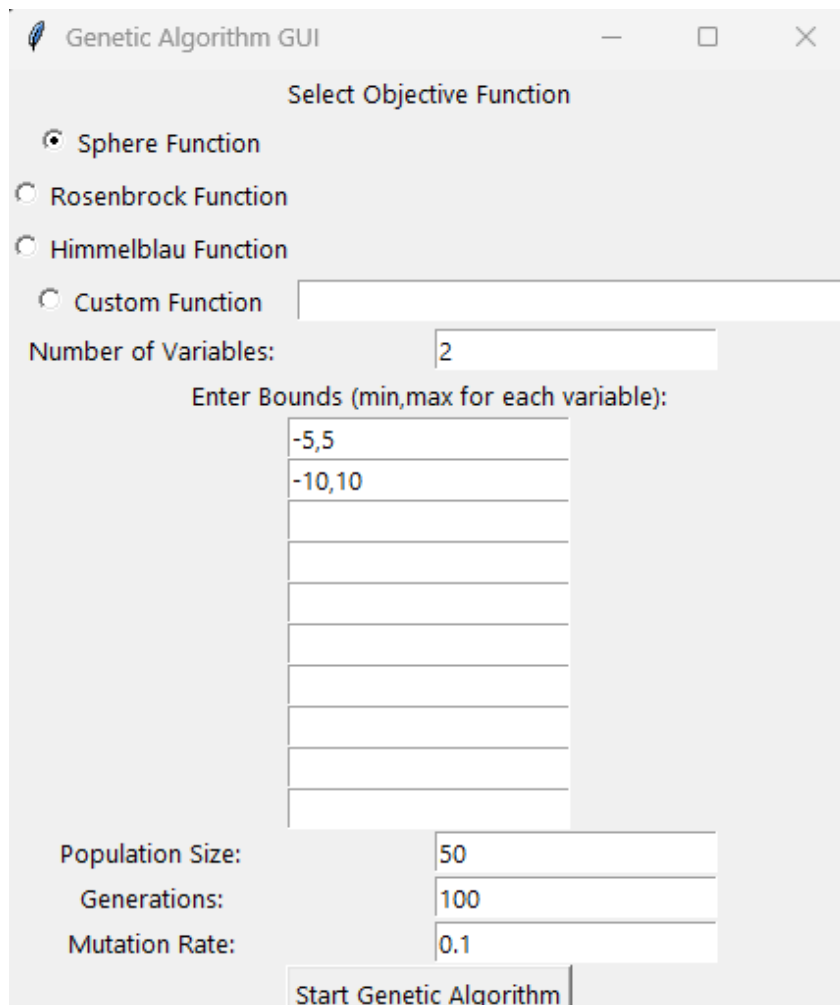

This section presents the results of the Simple Genetic Algorithm (SGA) tested on three classical benchmark objective functions: Sphere Function, Rosenbrock Function, and Himmelblau Function. The results are illustrated through visualizations and table of the search process and the convergence of the algorithm for each function with detailed explanation of the correctness.

5.1 Sphere Function

The Sphere function is defined as:

$$f(x) = \sum_{i=1}^n x_i^2$$

where x_i represents the variables of the function. The global minimum is at (0,0). To evaluate the correctness of the SGA in the sphere function, the computed solution and fitness score need to be as close to 0. In some cases the solution and fitness source can achieve a very small value (e.g., 10^{-9}) as seen in the solutions below (figure 4, 5 & 6).

The screenshot shows a window titled "Genetic Algorithm GUI" with a "Select Objective Function" section. The "Sphere Function" is selected with a radio button. Below this, there are input fields for "Number of Variables:" (set to 2), "Population Size:" (set to 50), "Generations:" (set to 100), and "Mutation Rate:" (set to 0.1). A "Start Genetic Algorithm" button is at the bottom. The "Enter Bounds (min,max for each variable):" section contains a table with two rows of input fields, the first two containing "-5,5" and "-10,10".

Enter Bounds (min,max for each variable):	
-5,5	
-10,10

5.2 Rosenbrock Function

The Rosenbrock function is defined as:

$$f(x) = \sum_{i=1}^{n-1} [100(x_{i+1} - x_i^2)^2 + (x_i - 1)^2]$$

The global minimum is at $x = 1$, with $f(x) = 0$. The correctness of the SGA can be proved by having the final best solution as close as possible to $[1,1]$ and the final fitness score as close as to 0. Figure 9 & 10 show that the algorithm did converge close to the global minimum, proving the correctness of our SGA implementation.

The screenshot shows a window titled "Genetic Algorithm GUI" with standard window controls. The "Select Objective Function" section has four radio buttons: "Sphere Function", "Rosenbrock Function" (which is selected), "Himmelblau Function", and "Custom Function". Below this, the "Number of Variables:" is set to "2" in a text box. The "Enter Bounds (min,max for each variable):" section contains a vertical stack of text boxes; the first two are filled with "-5,5", and the remaining six are empty. At the bottom, there are three more text boxes: "Population Size:" with "50", "Generations:" with "100", and "Mutation Rate:" with "0.1". A "Start Genetic Algorithm" button is located at the bottom right of the form.

Figure 10: Generation-wise Best Solutions and Fitness Convergence

5.3 Himmelblau Function

The Himmelblau function is defined as:

$$f(x, y) = (x^2 + y - 11)^2 + (x + y^2 - 7)^2$$

The function has four global minima:

- $[3, 2]$, where $f(3, 2) = 0$
- $[-2.805118, 3.131312]$, where $f(-2.805118, 3.131312) = 0$
- $[-3.779310, -3.283186]$, where $f(-3.779310, -3.283186) = 0$
- $[3.584428, -1.848126]$, where $f(3.584428, -1.848126) = 0$

To prove the correctness of the SGA, the best solution must converge to 1 of the 4 global minima, that is the final best solution as close as possible to 1 of 4 global minima. The final fitness score must be as close as to 0. Figure 13 & 14 indicate that the algorithm did coverage as close as possible to the global minimum, thus proving the correctness of our SGA implementation.

The screenshot shows a window titled "Genetic Algorithm GUI" with a light blue header. Below the header, there is a section titled "Select Objective Function" with four radio button options: "Sphere Function", "Rosenbrock Function", "Himmelblau Function" (which is selected), and "Custom Function". Below this, there is a text input field for "Number of Variables:" with the value "2" entered. Underneath, there is a section titled "Enter Bounds (min,max for each variable):" followed by a vertical stack of eight text input fields. The first two fields contain the values "-3,3" and "-5,5" respectively, while the remaining six fields are empty. At the bottom of the GUI, there are three more text input fields labeled "Population Size:", "Generations:", and "Mutation Rate:", with values "50", "100", and "0.1" entered respectively. A "Start Genetic Algorithm" button is located at the bottom right of the window.

6. Test Runs on Custom Objective Functions

This section presents the results of 2 given objective functions by Dr. Ilias S. Kotsireas, Professor.

6.1 Custom Function 1

For $n = 3$, the following expression is used:

$$|a_0a_1 + 2b_0b_1 + 2c_0c_1 + 2d_0d_1 + 2e_0e_1 + 2f_0f_1 + 2g_0g_1 + 2h_0h_1 + i_0i_1 + 8|$$

```
def n3_function(x):  
    return np.abs(  
        x[0] * x[1] +  
        2 * x[2] * x[3] +  
        2 * x[4] * x[5] +  
        2 * x[6] * x[7] +  
        2 * x[8] * x[9] +  
        2 * x[10] * x[11] +  
        2 * x[12] * x[13] +  
        2 * x[14] * x[15] +  
        x[16] * x[17] +  
        8  
    )
```
